A report is given on a simple, readily reproducible wetting process which is suitable for wetting germanium at elevated temperatures with indium and its alloys. It essentially consists in that the oxide films on the starting materials are replaced by halide films and these are then reduced in a hydrogen atmosphere at moderately high temperatures. 'Pure' material surfaces are thus obtained, at least at the moment of contact between (Physics-Solid State, TT, v. 10, no. 4) (over)
